1997 Annual Access)	CC Docket No. 97-149
Tariff Filings)	
)	

DIRECT CASE OF ALIANT COMMUNICATIONS CO.

Aliant Communications Co. ("Aliant"), by its attorneys, hereby submits its direct case in response to the Federal Communications Commission's ("FCC" or "Commission") recent order in the above-referenced proceeding.¹ In that Order, the Commission designated for investigation a number of issues related to LEC annual access tariff filings. Although the Order addresses a broad range of issues, Aliant responds herein only to those paragraphs that are applicable to Aliant.

A. Common Line Issues

Actual BFP Revenue Requirements

Aliant has calculated its actual BFP revenue requirement for the 1991-1996 calendar years. These revenue requirements are calculated per instructions in Appendix B of the Order. The ARMIS data, calculations, and resultant revenue requirements can be found in Exhibit ACT-CAL.

To provide actual BFP revenue requirements for tariff years 1991/1992 through 1996/1997, Aliant split the actual calendar year BFP revenue requirement, calculated as instructed in the Order, by using ratios developed from Aliant's actual quarterly cost study BFP revenue requirements.

In the Matter of 1997 Annual Access Tariff Filings, CC Docket No. 97-149, Order Designating Issues for Investigation Memorandum Opinion and Order on Reconsideration, DA 97-1609 (July 28, 1997) ("Order").

Aliant calculated the BFP revenue requirement at a 11.25% rate of return in each of its actual quarterly studies. These revenue requirements were then used to split the appropriate calendar year BFP revenue requirements taken from Exhibit ACT-CAL. The resultant actual tariff year BFP revenue requirements and the calculations used to develop them are shown in Exhibit ACT-TY.

Projected BFP Revenue Requirements

Aliant has provided the projected BFP revenue requirements for the tariff years 1991/1992 through 1997/1998. These are the same BFP revenue requirements as provided in Aliant's tariff filings. The BFP revenue requirements are shown on the following corresponding exhibits:

Tariff Year	<u>Exhibit</u>
1991/1992	PROJ-RR
1992/1993	PROJ-RR
1993/1994	PROJ-93/94
1994/1995	PROJ-94/95
1995/1996	PROJ-95/96
1996/1997	PROJ-96/97
1997/1998	PROJ-97/98

Comparison of Actual and Projected BFP Revenue Requirements

Aliant has provided a comparison of its actual and projected BFP revenue requirements as requested by the Commission. This information is shown on Exhibit RRQ-COMP. As the growth rates exhibited show, Aliant fails the Commission's 10 percent test for significant differences each year. Aliant's use of a 2 point linear projection will fail the type of test the Commission is using.

Though Aliant fails the Commission's ten percent test each year, Aliant does not feel it necessarily indicates significant differences. As indicated on the exhibit, Aliant's growth rate for the 1992/1993 tariff year is actually -0.7% and projected was -0.9%, for a dollar difference of \$15,000. Aliant does not consider this to be a significant difference.

Impacts of Rule Changes

As requested, Aliant has provided adjusted BFP revenue requirements for the calendar years 1991 through 1996. These revenue requirements were adjusted to show the impact of rules in effect December 31, 1996, had they been in effect starting January 1, 1991. Aliant adjusted its revenue requirements for: 1) a 25% interstate Subscriber Plant Factor (SPF), effective January 1, 1993; 2) the change in Dial Equipment Minutes of use (DEM), effective January 1, 1993; 3) the reallocation of General Support Facilities (GSF), effective July 1, 1993; and 4) the treatment of Account 4310, beginning January 1, 1993 and ending December 31, 1995.

Aliant did not adjust its revenue requirements for Other Billing and Collection (OB&C) expenses. Aliant has always used a 5% common line allocation for OB&C; therefore, no adjustment was necessary. Aliant's OB&C 5% common line allocation can be verified by reference to Aliant's FCC Report 43-04, the ARMIS Annual Access Report.

Aliant determined the necessary SPF adjustments by applying a 25% interstate SPF allocation in its actual 1991 and 1992 quarterly cost studies. The actual BFP revenue requirement was then subtracted from the BFP revenue requirement taken from the adjusted quarterly studies. The resultant impact of SPF is shown in Exhibit RRQ-EFF.

Aliant determined the necessary DEM adjustments by applying the January 1, 1996 rules to the DEM factor in its actual 1991 and 1992 quarterly cost studies. The actual BFP revenue requirement was then subtracted from the BFP revenue requirement taken from the adjusted quarterly studies. The resultant impact of DEM is shown in Exhibit RRQ-EFF.

Aliant determined the necessary GSF adjustments by applying the GSF allocation rules in effect January 1, 1996 to its actual 1991, 1992, and 1993 quarterly cost studies. The actual BFP

revenue requirement was then subtracted from the BFP revenue requirement taken from the adjusted quarterly studies. The resultant impact of GSF is shown in Exhibit RRQ-EFF.

Aliant determined the necessary Account 4310 adjustments by removing this account from those studies which had included it in the determination of its rate base. These studies were Aliant's 1993, 1994, and 1995 quarterly cost studies. The actual BFP revenue requirement was then subtracted from the BFP revenue requirement taken from the adjusted quarterly studies. The resultant impact of Account 4310 is shown in Exhibit RRQ-EFF.

To determine the necessary impact of SERIES I adjustments, as requested in paragraph 22 of the Order, Aliant applied the SPF, DEM, and GSF changes to its actual quarterly cost studies. The actual BFP revenue requirement was then subtracted form the BFP revenue requirement taken from the adjusted quarterly studies. The resultant impact of SERIES I adjustments are shown on Exhibit RRQ-EFF. Aliant notes that the individual impact figures shown on Exhibit RRQ-EFF will not add up to the figures shown for the SERIES I and SERIES 2 adjustments impacts. This is due to overlaying effects of multiple rule changes when applied in one single application.

To determine the necessary impact of SERIES 2 adjustments, Aliant applied the SPF, DEM, GSF, and Account 4310 changes to its actual quarterly cost studies. The actual BFP revenue requirement was then subtracted from the BFP revenue requirement taken from the adjusted quarterly studies. The resultant impact of SERIES 2 adjustments is shown in Exhibit RRO-EFF.

Adjusted BFP Revenue Requirement

Aliant has provided Exhibit RRQ-ADJ. This exhibit shows the impact of SERIES 1 and 2 being added to the actual BFP revenue requirement as calculated per Commission instructions in

Appendix B of the Order. Also shown is the relative year-to-year changes in each series of actual BFP revenue requirements.

Methodology of Projecting BFP Revenue Requirements

Aliant has used the same method of projecting BFP revenue requirement since its initial price cap filing in 1993, with small modifications in the 1993 and 1994 filings due to rule changes which will be discussed in later paragraphs. To project its BFP revenue requirement, Aliant computes the interstate BFP revenue requirement (at 11.25% rate of return) growth rate between the base period and the previous base period. This growth rate is applied to the base period interstate BFP revenue requirement (at 11.25% rate of return) and then factored to include the six month lag between annual and tariff year timelines.

The 1993 and 1994 tariff filings were modified to include the effect of the phase-in of a 25% SPF allocator. Since either, or both, base period and previous base period interstate BFP revenue requirements were based on SPF allocators greater than 25%, Aliant adjusted its calculation to remove the effect of SPF allocators greater than 25%. To do this, Aliant factored the appropriate base period interstate BFP revenue requirement to arrive at an unseparated BFP revenue requirement. The growth rate of the corresponding unseparated BFP revenue requirements was then computed and applied to the base period revenue requirement. This projected unseparated BFP revenue requirement was then multiplied by 25% to represent the SPF factor in the projected tariff year.

The methodology and calculations used in projecting BFP revenue requirement in each price cap filing can be found on the following exhibits:

Tariff Year	<u>Exhibit</u>
1993/1994	PROJ-93/94
1994/1995	PROJ-94/95
1995/1996	PROJ-95/96
1996/1997	PROJ-96/97
1997/1998	PROJ-97/98

OB&C Order

On February 3, 1997, the Commission released its order in CC Docket No. 80-286.² This order stipulated that local exchange carriers who perform end-user billing for interexchange carriers were to change the allocation of Other Billing & Collection (OB&C) expenses. Prior to this order, local exchange carriers allocated this expense between the jurisdictions based on an analysis of user and message counts. This order changed the allocation method to a direct allocation of one-third to interstate and two-thirds to the state jurisdiction for carriers that perform end-user billing for interexchange carriers.

Aliant calculated an exogenous change to reflect this Commission mandated separations rule change. Aliant calculated this change by applying the new OB&C allocation to its base period cost studies. The actual base period cost studies were then subtracted form the modified base period cost studies to determined the OB&C exogenous cost used in Aliant's filing on April 2, 1997.

Allocation of Other Billing & Collection Expense

	<u>Interstate</u>	<u>State</u>
Actual Base Cost Studies	12.33%	87.67%
Modified Base Cost Studies	33.33%	66.67%

Amendment of Part 36 of the Commission's Rules and Establishment of a Joint Board, CC Docket No. 80-286, Report and Order, FCC 97-30.

The resultant change in BFP revenue requirement and, thus, Aliant's OB&C exogenous cost in its tariff filing was \$122,503.

Payphone Reconsideration Order

In its December 6, 1996 Payphone Tariff Filing, Aliant calculated the exogenous cost change for pay telephones by dividing the 1995 pay telephone revenue requirement by the sum of the 1995 total common line revenue requirement and LTS requirement. This exogenous factor was then multiplied by the negative of the common line R value to arrive at the exogenous cost change. The calculations and impact of this exogenous change can be found in Exhibit EXG-PAY.

Methodology of Projecting Billable Access Lines

Aliant has provided its actual average number of total billable access lines, multi-line business, residence and single-line business line and its projections of total lines for the past 6 tariff years from 1991/1992 to 1996/1997. Aliant has also provided a comparison of its actual and projected lines, as requested by the Commission. Using the Commission's methodology to determine whether the difference between actual and projected access lines are significant, Aliant's projection of total lines from 1993 to 1996 are determined to be significantly different from actual lines. See Exhibit AVR-ACT.

Aliant projected access lines by computing the growth rate of its average access lines between the base period and previous base period in each price cap tariff filing. This growth rate was then applied to the average base period lines and factored for the six month lag between annual and tariff year time periods. The methodology and calculations used in projecting billable access lines for each price cap filing can be found in the following exhibits:

Tariff Year	Exhibit
1993/1994	PROJ-93/94
1994/1995	PROJ-94/95
1995/1996	PROJ-95/96
1996/1997	PROJ-96/97
1997/1998	PROJ-97/98

Aliant's actual access line count is growing faster than its 2 point linear projection predicted and therefore, the projections are different than actual. This difference is evidence of a change in the underlying trend of end-user demand. Aliant did not project lines for each individual class of lines.

End-User Demand Trend Analysis

Aliant provides a trend analysis using the actual number of lines for calendar year data from 1991-1996, as reported in ARMIS. This analysis can be found on Exhibit ACT-PROJ. Aliant calculated a trended percentage change and a projected percentage change. Then, using the Commission's methodology to determine whether the difference between actual and projected lines are significant, Aliant determines that its projection of 1997-1998 lines are significantly different from the trend analysis projection. See Exhibit ACT-COMP.

Aliant used a 2 point linear projection methodology. This differs from the Commission's trend analysis which used data from 1991-1996 and therefore, the projections are different for 1997-1998.

Aliant then constructed, using the t distribution, a ninety-five (95) percent confidence interval centered around the value predicted by the historical trend analyses of end-user demand required by the Commission for the 1997-1998 tariff year. Aliant's 1997-1998 tariff year projected growth rate falls within this confidence interval. Subsequently, Aliant would argue that, although

Aliant's projection does not pass the plus or minus ten percent test required by the Commission, Aliant's projection is statistically valid.

Aliant also provides a trend analysis using the natural logarithm of lines for calendar year data from 1991-1996. This analysis can be found on Exhibit NL-PROJ. Aliant calculated a trended change and the projected change. Then, using the Commission's methodology to determine whether the difference between actual and projected lines are significant, Aliant determines that its projection of 1997-1998 lines are significantly different from the trend analysis projection. See Exhibit NL-COMP.

Aliant used a 2 point linear projection methodology which differs from the Commission's trend analysis which used data from 1991-1996 and therefore, the projections are different for 1997-1998.

Similarly, Aliant constructed, using the t distribution, a ninety-five (95) percent confidence interval centered around the projected growth rate from the historical trend analyses using the natural log of end-user demand required by the Commission for the 1997-1998 tariff year. Aliant's 1997-1998 tariff year projected growth rate, using the natural log, falls within the confidence interval. Subsequently, Aliant would again argue that, although Aliant's projection does not pass the plus or minus ten percent test required by the Commission, Aliant's projection is statistically valid.

Payphone Line Projections for 1997/1998 Tariff Year

Aliant does not forecast billable access lines by class of line. No special analyses of payphone lines were used in Aliant's projection of access lines for its 1997/1998 tariff.

Change in Semi-Public Payphone EUCL

Aliant has 299 semi-public payphone lines which changed from being charged single-line business EUCL charges to multi-line business EUCL charges.

ISDN Line Projections

Aliant does not forecast billable access lines by class of line. No special provision for ISDN lines was made in Aliant's projection of 1997/1998 access lines.

Per-Line BFP Revenue Requirement

Aliant has calculated the actual per-line BFP revenue requirement and the projected per-line BFP revenue requirement as instructed in the Order. This information can be found in Exhibit BFP-LINE.

B. Equal Access Exogenous Cost Changes

Initial Local Switching Revenue

Aliant's local switching revenue in its initial price cap filing was \$8,000,129.

C. Conclusion

Aliant Communications Co. respectfully requests that the Commission accept the direct case stated above.

Respectfully submitted,

Robert A. Mazer Albert Shuldiner
